internacional

At Shareppy International we provide solutions for the financial sector.

We work so that banks and the cooperative sector can meet the needs of their clients, through tools such as Biometrics.

Biometrics is an application designed for the identification, registration and authentication of the client through biometric devices in the processes of the entity.

It can thus improve the response times for the entity's processes by capturing biometric elements and interacting them with the entity's Smart Road or Core modules.

The tool is compatible with multiple digital scanner, which facilitates its use, since it can be used with equipment that entity already has.

With this tool you can perform operations on both mobile devices and computing equipment, which makes the job easier. It can also be integrated with entity providers for data authentication.

The capture of biometric elements can be configured for a specific person or at the general level of the entity.

This method of identification by means of footprint allows to register the client/associate in the entity, optimizing the processes of linking, product opening, collection and other products that require identification.

The tool performs biometric enrollment whose mission is to scan fingerprints, photograph, identification document and signature capture.

This ensures the safety of the processes.

## Benefits and results

1. It reduces the risk of fraud and identity theft. It confirms that the person who's validating is in fact who he claims to be.
2. Facilitates the signing of documents and promissory notes using the imprint on them.
3. Avoids the displacement of clients, for the granting of credits. External commercial force can use this tool for biometric document signing.
4. Strengthens zero-role policies, contributing to environmental protection.
5. Allows the saving of fingerprint templates to perform authentication validations of registered clientes, improving response times.
